

Solving Division Practice

Division is simply the reverse of multiplication. When you see a problem like $7 \overline{)14}$, say to yourself, 'seven times what makes 14?' or 'how many 7's in 14?' Both ways will work. Seven times **two** makes fourteen and there are **2** sets of 7 in 14. So the answer would be 2.

Solve by asking either question.

$$\begin{array}{r} 7 \\ \times \quad \quad \\ \hline 14 \end{array}$$

$$7 \overline{)14}$$

$$\begin{array}{r} 7 \\ \times \quad \quad \\ \hline 28 \end{array}$$

$$7 \overline{)28}$$

$$\begin{array}{r} 7 \\ \times \quad \quad \\ \hline 63 \end{array}$$

$$7 \overline{)63}$$

$$\begin{array}{r} 7 \\ \times \quad \quad \\ \hline 49 \end{array}$$

$$7 \overline{)49}$$

$$\begin{array}{r} 7 \\ \times \quad \quad \\ \hline 42 \end{array}$$

$$7 \overline{)42}$$

$$\begin{array}{r} 7 \\ \times \quad \quad \\ \hline 35 \end{array}$$

$$7 \overline{)35}$$

$$\begin{array}{r} 7 \\ \times \quad \quad \\ \hline 7 \end{array}$$

$$7 \overline{)7}$$

$$\begin{array}{r} 7 \\ \times \quad \quad \\ \hline 56 \end{array}$$

$$7 \overline{)56}$$

$$\begin{array}{r} 7 \\ \times \quad \quad \\ \hline 21 \end{array}$$

$$7 \overline{)21}$$

$$\begin{array}{r} 7 \\ \times \quad \quad \\ \hline 70 \end{array}$$

$$7 \overline{)70}$$
